

- Q.27 Explain Bleeding disorders and write name of related diseases.
- Q.28 Explain the procedure of Perls' Prussian blue reaction.
- Q.29 Write the FAB classification for acute myeloid leukemia.
- Q.30 Explain the laboratory findings in chronic myeloid leukemia.
- Q.31 What is the LE cell? How it can be demonstrated?
- Q.32 Describe the principle of semen analysis.
- Q.33 Explain the importance of sperm count and motility in fertility assessment.
- Q.34 Describe the method of counting cells in cerebrospinal fluid (CSF)
- Q.35 List the reference values of PT, APTT, BT, and CT.

SECTION-D

- Note:** Long answer type questions. Attempt any two questions out of three questions. (2x10=20)
- Q.36 Define haemostasis. Explain in detail the mechanisms involved -vascular, platelet, and coagulation phases-with diagram.
- Q.37 Describe the methods of bone marrow aspiration, staining, and examination. Discuss its clinical significance.
- Q.38 Define leukemia. Explain its classification, pathophysiology, and laboratory diagnosis with reference to the FAB system.

No. of Printed Pages : 4 181942/121942/031942
Roll No.

4th Sem / DMLT

Subject:- Haematology - IV / Clinical Haema - IV

Time : 3Hrs.

M.M. : 100

SECTION-A

Note: Multiple choice questions. All questions are compulsory (10x1=10)

- Q.1 The first step in hemostasis is:
- Platelet plug formation
 - Vasoconstriction
 - Coagulation
 - Fibrinolysis
- Q.2 Factor VIII deficiency causes:
- Hemophilia A
 - Hemophilia B
 - Von Willebrand disease
 - DIC
- Q.3 Prothrombin is converted to thrombin by:
- Factor X
 - Factor IX
 - Factor XIII
 - Fibrin
- Q.4 Normal platelet count in adults is approximately
- 1-1.5 lakh / μ L
 - 2-4 lakh / μ L
 - 4-6 lakh / μ L
 - 50,000-80,000 / μ L

- Q.5 Bone marrow aspiration is usually done from:
- Tibia
 - Iliac crest
 - Sternum
 - Both B and C
- Q.6 M:E ratio refers to the ratio between:
- Myeloid and erythroid cells
 - Monocytes and eosinophils
 - Mature and early cells
 - None of these
- Q.7 The stain used for bone marrow iron detection is:
- Leishman stain
 - Wright's stain
 - Perls' Prussian blue stain
 - Giemsa stain
- Q.8 In chronic myeloid leukemia, the characteristic chromosome is:
- Philadelphia chromosome
 - Bence Jones protein
 - Barr body
 - Reedsternberg cell
- Q.9 The main diagnostic cell in LE cell phenomenon is a:
- Lymphocyte
 - Neutrophil
 - Monocyte
 - Basophil
- Q.10 The motility of sperm is observed using:
- Low power lens
 - High power lens
 - Oil immersion lens
 - Phase contrast microscope

(2) 181942/121942/031942

SECTION-B

Note: Objective type questions. All questions are compulsory. (10x1=10)

- Q.11 Define coagulation.
- Q.12 Name any two natural anticoagulants present in the blood.
- Q.13 What is the full form of INR?
- Q.14 Write the normal value of bleeding time.
- Q.15 Write the main function of bone marrow.
- Q.16 What is the normal color of bone marrow aspirate?
- Q.17 Mention one difference between acute and chronic leukemia.
- Q.18 Name the test used to detect LE cells.
- Q.19 Define semen liquefaction time.
- Q.20 Write any one biological fluid other than blood used for cell counting.

SECTION-C

Note: Short answer type questions. Attempt any twelve questions out of fifteen questions. (12x5=60)

- Q.21 Describe the process of platelet plug formation.
- Q.22 Write the theory of coagulation according to the cascade model.
- Q.23 Explain the principle and clinical importance of Prothrombin Time(PT)
- Q.24 Define INR and explain its importance in anticoagulant therapy.
- Q.25 Write short note on Hess test.
- Q.26 Describe the composition of normal bone marrow.
