The Earth is surrounded by a layer of gases called the atmosphere. This layer acts like the glass of a greenhouse. Under normal conditions, the atmosphere allows sunlight to reach the surface to warm the planet, while “Greenhouse Gases” like carbon dioxide (CO₂) and methane (CH₄) trap just enough heat to keep us from freezing. Without this natural process, Earth’s average temperature would be frigid.

However, human activities-such as burning fossil fuels for cars and cutting down vast forests-have increased the concentration of these gases. This is like thickening the glass of the greenhouse; too much heat is being trapped. This phenomenon is known as Global Warming.

The Consequences are visible worldwide. Polar ice caps are melting, causing sea levels to rise and threatening coastal cities. Weather patterns are also becoming more extreme, leading to longer droughts in some areas and severe flooding in others. Protecting our environment now requires a shift toward

renewable energy and a global effort to plant more trees, which act as “Carbon sinks” by breathing in CO₂

- Q.11 What is the “Greenhouse Effect”?
- Q.12 List two specific Greenhouse Gases mentioned in the passage.
- Q.13 Why are forests referred to as “carbon sinks”?
- Q.14 Identify two human activities that have contributed to the thickening of the “greenhouse glass”.
