

- Q.15 Describe the principle behind the separation of starch and gluten during the wet milling of corn.
- Q.16 List the main steps involved in the processing of oats for human consumption. Why is a specific drying or kilning step crucial for oat processing?
- Q.17 Give two examples of secondary processing of cereals and millets . How does this add value to the primary products?
- Q.18 What are two important hysic-chemical properties of cereals and millets that affect their processing and final product quality? Briefly explain their significance.

SECTION-D

Note: Long answer type questions. Attempt any one questions out of two questions. (1x10=10)

- Q.19 Elucidate the detailed process of corn wet milling, specifying the role of steeping and the subsequent separation techniques employed. Name the major products and by-products obtained from this process.
- Q.20 Outline the different stages and machines involved in a modern, multi-stage rice milling operation, from paddy intake to the final packaged product.

SECTION-A

Note: Multiple Choice questions. All questions are compulsory. (5x1=5)

- Q.1 The process of soaking paddy in hot water followed by steaming and drying before milling is known as :
- a) Polishing b) Parboiling
- c) Conditioning d) Dehulling
- Q.2 In wheat milling, the purpose of the “break system” is to _____
- a) Separate the endosperm from the bran and germ
- b) Reduce the endosperm into fine flour
- c) Bleach the flour
- d) Stabilize the wheat germ

- Q.3 Which of the following is a key step in the wet milling of corn?
- Passing the corn through a series of rollers
 - Tempering the corn kernels
 - Steeping the corn kernels in a solution of sulfur dioxide
 - Breaking the corn into grits
- Q.4 Which component of the wheat kernel has the highest gluten content?
- Bran
 - Germ
 - Endosperm
 - Aleurone layer
- Q.5 Which of the following is a major byproduct of the dry milling of corn?
- Gluten
 - Corn starch
 - Corn oil
 - Grits

SECTION-B

Note: Objective type questions. All questions are compulsory. (5x1=5)

- Q.6 The extraction rate on wheat milling has no effect on the final flour's composition. (True/False)
- Q.7 The process of converting barley into malt is known as _____.

- Q.8 What is the key enzyme responsible for the rapid degradation of rice bran?
- Q.9 Breakfast cereals that are produced by forcing a dough through die under high pressure are known as _____ cereals.
- Q.10 What is the common name for the milling process of rice that involves rubbing action to remove the bran layers?

SECTION-C

Note: Short answer type questions. Attempt any six questions out of Eight questions. (6x5=30)

- Q.11 Explain the process of parboiling paddy and state two key benefits it provides during rice milling and for the final product.
- Q.12 Why is it necessary to stabilize rice bran? Briefly explain one common method used for stabilization.
- Q.13 Define the term "extraction rate" for wheat flour. How does increasing the extraction rate affect the nutritional composition and quality characteristics of the flour?
- Q.14 Briefly outline the primary steps involved in the wet milling of corn. What are the key end products of this process?
